BIBLIOTEKA UNIWERSYTECKA

Bibliothecæ Mathematicæ,
Collegii Posnanienſis. Soc: JESU.

SERENISSIMO ET POTENTISSIMO DOMINO, D. CHRISTIANO 4. DANIÆ, NORVEGIÆ, SCLAVORVM, VANDALORVM, Gotthorũque Regi Illustrissimo: Slesvici, Holsatiæ, Stormariæ ac Dithmarsiæ Duci: Comiti in Oldenburgo & Delmenhorst &c. domino suo dignissimo.

QVI Liberalium artium ex animo capiuntur amore, Rex Illustrissime, honestarum disciplinarum nullum intentatum relinquunt genus. Quare ab infimis elemẽtis, ad summa vsque scandentes, ipsos etiam Cæli motus, Stellarumque habitudines, & Astrorum figuras, formasve; mentis acie penetrare & cognoscere studeant. Ego equidem ipsorum exemplo motus, ante annos plus minus quadraginta, ad Astrorum cursus, non sub tugurio, verum in ipso Cælo observandos me tradidi; maxime quod Ephemerides, cum ex Tabulis Alphonsinis, tum Prutenicis, alijsve supputatæ, vt plurimum ab observationibus dissentiant. Exercitium hoc pluribus continuis annis, alacri & indefesso animo, constanti, assiduoque labore persequutus sum, donec ad novarum Tabularum Astronomicarum compositionem, me satis instructum conspexi. Deliberaui diutius ob operis difficultatem, an Tabularũ conditioni incumberem: tandem sedulis quorundam amicorũ precibus superatus, ad compositionem me accinxi. Quare certitudine nostrarum obseruationum fretus, nostras motuum cælestium cõsiderationes, cum Illustrium artificum, vt pote Ptolomæi, Hipparchi, Albategnij, Regiomontani, Copernici, aliorumque Neotericorum observationibus conferens, Tabulas nostras Belgicas, Dei ter Maximi benignitate, incepi, condidi & absolvi; motuumque calculum, ipsamque Astronomiam, pro viribus nostris, restitui & renovavi. Demum Astronomico assidẽs abaco, Ephemerides annorum vnum & viginti, summa cum diligentia, assiduoque labore, ex nostris novis supputauimus Tabulis; quas Philomatibus, vestris auspicijs, communicare decrevi; vt absque calculi molestia, Erraticarum motus haberent certiores. Sed forsan mirabitur quis, quod adeo a communi supputatione, immo & a Recentiorum Tabulis aliquando differam. At obsecro, rem prius sedulo consideret; venetur certas inerrantium sedes, Erraticarum cum ipsis Synodos, mutuasque Planetarũ Syzygias in Ephemeridibus nostris

adnotatas, non ad focum, sed sub dio, in ipso cælo observet: si tunc animadvertit me cum cæteris hallucinari, ridiculum dixerit: Si felicius prædicere, scopum ve tangere, labores nostros atque vigilias ne cõtemserit, nec nos canino rodat, mordeatve dẽte. Momis lõge facilius est, alterius detrahere labori, quam emendare. Sed spero me Astrophilorum odium non demeriturum, quod hosce nostros labores eis dederim fruendos; præsertim cum sciam eos peritorum Mathematicorum iudicium nullatenus subterfugere.

Quod superest R.S. Tibi has Ephemerides, primum nostrarum Tabularum fœtum consecrare, ac dedicare, vestrisque auspiciis in Lucem prodire volui; non vt ignaviæ aut inertiæ subsidium & patrocinium quærerem, sed vt gratitudinis documẽtum relinquerem. Quod si hunc nostrum laborem, vobis gratum & acceptum percepero, stimulum dabis in vlteriores 30. aut 40. annos, easdem producere, & Tabularum Belgicarum editionem, conatusque meos in commune studiosorum commodum, ad alia in lucem proferenda, promovebis. Verum hæc plus satis apud tantum Regem, cuius ocium summe negocioſum habetur. Servet M.T. Regiam, cum tota tua Illustrissima domo, D.O.M. incolumem, felicem, & prosperam, annosque Nestoreos cõcedat. Vale.

Maiestati tuæ

DE EPHEMERIDIS INSTRVCTIONE ATQVE VSV.

IN primis ponitur numerus Anni, ad quem Planetarum diarius ſpectat motus: et annis, quos ſecundum Eccleſiæ Catholicæ conſuetudinem, ab incarnatione Ieſu Chriſti Domini noſtri continuando numerare ſolemus, in ipſo frontiſpicio cuiuſlibet Ephemeridis addidimus, tanquam Epochas ſiue Radices, annos ab aliquarum rerum memorabilium principijs numeratos: vt pote, Mundi Conditi, et formationis hominis, Diluuij, Primique Paſchatis. His et adiunximus Annos Olympiadum, ánnoſque ab initio Regni Nabonaſſaris, qui in ſacris literis Salmanaſſar eſt, et ab obitu Alexandri Magni, inchoantes. Id tamen inter has differt Epochas, quod anni a Mundo condito, a Diluuio, et a primo Paſchate, æque ac Anni a Chriſto nato, Anni ſunt Iuliani: qui propter quadrantem diei ſuperantem, ſingulis quaternis annis, diem unum intercalarē adijciunt. Reliqui vero anni, cum a Nabonnaſſaré, tum ab Alexandri magni obitu, ſunt Ægiptij, qui e diebus trecentis et ſexaginta quinque, diei quadrante omiſſo, conſtant.

Epochis præmiſſis, pagina ſecunda, adijcimus Præceſſionem Æquinoctiorum, hoc eſt, diſtantiam Capitis Arietis Sphæræ nonæ, ab Arietis Octauæ ſphæræ prima ſtella. Præterea omnium Erraticarum, præter Lunam, Apogæa in orbe Ecœntrico conſyderata: Annique Tropici veram ſiue apparentem magnitudinem.

Succedunt his Cæleſtia Themata, ſiue ſyderum conſtitutiones, ſub Solis introitum in quatuor Cardinalia puncta, qnæ quatuor Anni temporibus accommodantur.

Poſt ſequitur Aureus Numerus, Cyclus ſolaris, litera Dominicalis. Indictio Romana, Interuallum, cæteraque feſta Mobilia, vtrique cum Antiquo, tum nouo Gregoriano ſtylo inſeruientia: & ſi quod Luminarium eo ipſo anno luminis patietur defectum, tēpus apparens mediæ Eclypſis, Tempus incidentiæ, dimidiaq; mora, ſi adeſt, ac Digiti Ecliptyci, debita cum figuratione, adnotantur. Hæc equidem ad apparentiam Horizontis Brugenſis ſupputata ſunt, quæ levi adhibita cautiuncula, cæteris totius Europæ Regionibus & locis vtiliter inſeruiunt.

Præterea adijcitur Quinque Erraticarum Regreſſus, & quibus diebus regredi incipient, quantumque cuiuſque ſit duratura Regreſſio, ſi modo eam eſt habitura: Inſuper quoties Mercurium regredi continget, certis diebus explicatur. Nos, ſicut & cæteri, motuum textui, ſyllabis Re. & Di, loca & Tempora Regreſſuum & Directionum quinque Planetarum, notauimus.

Iam verſo folio, duplex offertur literarum ſpecies. Siniſtra quidem facie, numeri verorum motuum gradibus & ſcrupulis diſponuntur. Verum quo diſtinctius ſingula diſ-

cernas, in ea facie notatur Mensis cum suis præcipuis diebus festiuis: vbi & ad extremã marginis oram, vt nostræ Ephemerides omnibus nationibus satisfaciant, literam Dominicalem repetitam, diesque mensis styli veteris ponimus, ac literam Dominicalem; ita tamen vt semper dies primus Mensis singuli styli antiqui, concurrat cum die vndecimo mensis eiusdem, styli Gregoriani. Sed dies festiui ad stylum pertinent Gregorianum; a quorum dextra dies mensis Gregoriani anni, literaque Dominicalis repetita, ponuntur: vt certo, cunctisque noto tempori, certus assignetur motus. Succedunt deinceps Columnulæ octo, lineis singularibus discretæ: quarum prima est Solis; altera Lunæ; octaua vero Capiti Draconis Lunaris dicatur. Reliquæ quinque mediæ, quinque Planetis, nimirum Saturno, Ioui, Marti, Veneri & Mercurio appropriantur, characteribus etiam proprijs hunc ordinem superne commonstrantibus. Singulæ quoque columnulæ duplicem habẽt numerorum ordinem, nempe graduum, & scrupulorum, præter Solis columnulam, quæ triplici numerorum gaudet ordine, scilicet graduum, scrupulorum primorum & secundorum, per literas. G. Scr. 2. qui cuius sint signi proxime superpositus Character indicat.

Omnis autem motus verus hic positus, ad Meridiem refertur diei, cuius numero gradus & scrupula talis motus opponuntur. Dies quoque æquales supponimus, prout Astronomicus exigit abacus. Qui vero petit Lunæ motum verum ad Meridiem vulgarem, quo scilicet Sol Meridianum possidet, ad quem dies apparẽtes siue inæquales clauduntur; is cum vero loco Solis eiusdem diei, ingrediatur tabellam infra ponendam, vbi de dierum naturalium æquatione agemus; reperietque Lunæ motum, quantus temporis prosthaphæresi debebitur, vel addendum, vel subtrahendum motui, in Ephemeride scripto. Ibique & temporis prosthaphæresim inueniet, qua tempus æquale ad apparens reducitur. Hac quoque vtatur cautiuncula, quoties Lunæ locum verum in quopiam cælesti themate, siue Cæli facie, ponere velit. Sol autem & reliquæ Erraticæ, ob motus tarditatem, hac motus correctione non egent. Quæ quidem temporis æquatio in omnibus Luminum Syzygijs est obseruanda, cum solummodo tempori medio siue æquali sint applicatæ.

Est preterea & aliud æquationis genus, ob Meridianorum diuersitatem contingens, si momenta quælibet, quamuis exigua, persequi velis; quod equidem hac lege absolues

In tabula vrbium ac ciuitatum accipe tuæ habitationis nomen si illic sit scripta, aut vicinioris, numerumque, qui e directo eius, iuxta notam A & S. apparet; adde aut subtrahe, tempori cuiuslibet Coniunctionis, Plenilunij, aut Quadraturæ Luminarium, quod in textu Ephemeridis cuiuscunque scriptum est, prout nota Additionis aut Subtractionis exigit. Ea quippe columnula numerorum, quæ iuxta ordinem notarum A & S apparet, horas & horarum scrupula compræhendit.

Porro, si libeat motum alicuius Planetæ verum inquirere, ad horam diei quamcunque, excerpe motum eius diurnum, nempe differentiam duorum motuum immediate conscriptorum. Hoc motu ingredere Canonem motus horarij Planetarum. Quod vero e regione horarum & scrupulorum datorum reperies, motus est Planetæ, horis totidem congruens: Quem, si Planeta directus est, ad motum in Ephemeride scriptum addes. Sin autem Retrogradus, auferes; & quæsitum Erraticæ habebis motum.

Præ

Præterea cæteræ quinque Planetarum columnulæ, binas in capitibus gestant literas quæ singulorum latitudinis partem, ad mensium initia quodammodo produnt, nempe his duabus B A, Borealis Ascendēs illis vero B, D, Borealis descēdens. Sic M.D, Meridianum descendentem, & M.A, Meridianum Ascendentem significant.

Latitudines autem quinque Planetarum in gradibus & scrupulis, in calce cuiuslibet Mensis suprapositi, ad primum, Vndecimum & vigesimum primum mensis diem deprehendes; quæ secundum literarum Capitalium signationem suprapositam, nomen sortientur: nisi in textu numerorum, a capite ad calcem eiusdem columnulæ descendēdo, litera B aut M, vel A aut D, a capitibus discrepans, occurrerit. Tunc enim aut Planetæ latitudo, aut eius Ascensus vel Descensus in latitudine, pro literæ expressione mutabitur.

Lunæ vero latitudo, quæ a Nodo ascendente siue a Capite Draconis, ad Nodum vsque Descendentem, siue Draconis Caudam, Borealis est: in altero vero semicirculo, Meridionalis: quæ quanta sit, ex suo Canone infra posito, venabitur.

Hæc latitudinis consyderatio in Astronomicis magni vsus est. Nam cum ab Astronomo requiratur, vt verum stellæ situm in cælo sciat decernere: nullo modo solius longitudinis motu contentus esse potest; sed & earundem latitudines inquiret. Ea equidē neglecta, euenit sæpe, vt stella in horizōte existimetur esse, quæ dudū est exorta, aut multo post tempore tandem orietur. Quæ quidem res apud Astrologos magni ponderis est: ne stella aliqua in prima constituatur Cæli partitione, habeaturque benefica; quæ vere Duodecimam occupans domum, maleficæ conditionem induat: aut ne aliter eius varietur situs.

Nunc demum quæ in dextra notantur facie, addiscamus. Primum sex Columnulis, designantur aspectus Lunæ ad Solem & Planetas, siue Syzygiæ Lunares; quæ Solis & Planetarum sex proprios Characteres in aspectuum Capitibus habent; Aspectuum quidem differentiæ, per proprias notas significātur. Horæ vero, quibus aspectus hi perficiuntur, a Meridie initium sumunt. Verum Interlunia, Plenilunia & Quadraturæ, nō solum horis, sed & horarum scrupulis, in Solis Columnula signantur, iuxta quam a sinistris est numerus dierum cuiuslibet Mensis, duplici ordine positus; quorum prior stylo veteri, alter stylo nouo, siue Gregoriano congruit; vt cunctæ configurationes, temporibus certis assignari possint.

Sequuntur sparsim Syzygiæ Planetarum mutuæ, siue Configurationes Solis & Erraticarum inter se, prout motuum exigit ratio, insertæ: Neque deest Lunæ cum Nodis, seu Capite, Caudaque Draconis congressus. Præterea adiecimus, quibus diebus Luna & reliquæ quinque Erraticæ in Apogæis & Perigæis Epicycli constituuntur: sic quoque quando Sol Apogæus & Perigæus est in orbe Eccentrico.

Tandem peculiare quoddam Planetis a Sole accidens adnotatur: nempe quando sint Orientales aut Occidentales. Huiusmodi accidentia duplices docent syllabæ Or. & Oc, in capitibus Columnarum positæ. Quod si quocunque mensis die Orientales, aut Occidentales esse desinant, id inter Syzygias Lunares in proprijs columnulis die congruente, similibus notatur Syllabis. Tres quidem superiores, Saturnus, Iupiter & Mars, Orientales dicuntur, quandiu Sol post congressum ab eis recedens, ad eorum

pergit Diametrum: post vero Occidentales nominantur, donec ipsiis Sol iterum coniungitur. Venus atque Mercurius quandiu Solem Occidentem sequuntur, Occidentales appellantur: Sed cum mane ante Solem oriuntur, Orientales vocari solent.

Postremo in calce paginæ adscripsimus cui diei mensis cuiuslibet vsitati, congruat dies prima mensis alicuius Ægyptiorum. Et hactenus de serie atque dispositione Ephemeridum.

Quantas autem commoditates res illæ præbeant, ad multimoda Medicorum exercitia, ad aëris mutationes prædicendas, ad genituras humanas, annuasque conuersiones describendas, & ad Operum principia aggrédienda, adque alias ciuiles innumeros vsus, ex Astrologorum Commentarijs abunde cognosci potest.

CANON MOTVS HORARII PLANETARVM.

Omnes Erraticarum motus in Ephemeridibus scripti, sunt supputati ad horam 12. meridianam. Quod si ad quamcunque diei aliam horam, aut horæ scrupulum, Erraticæ motum scire lubeat, excerpe eius motum diurnum, assumptis duobus motibus: quorum alter erit meridiei proxime præcedentis, alter immediate sequentis: minorique ex maiore ablato, residuum numerum, nempe motum diurnum, in vertice quæres Canonis sequentis; area vero suppeditabit gradus & scrupula e regione datarum horarum & scrupulorum, in columnula sub diurno motu posita, qui Planetæ motus erunt, totidem horis & scrupulis inseruiens. Id quidem duplici introitu peragendum est, cum horis adhæserint scrupula. Hunc motum, si Planeta progreditur, motui addes in Ephemeride scripto: aut ab eodem subtrahes, si regreditur: & sic quæsitum Planetæ motum obtinebis.

Id equidem exemplis uno & altéro magis eluceſcet. Sit quærendus Lunæ motus ad diem. 21. Iunij, horam. 19. scrup. 28. anni 1595. In meridie diei. 21. Locus Lunæ est 24. gr. 12. scr. ♑: in meridie. 22. diei est 7. gr. 24. scr. ♒. Prior motus a secúdo subtractus, residuum erit, 13. gr. 12. scr. pro motu diurno. Cum hoc motu ingredior Canonem motus horarij, in capitibus columnarum quærens diurnum hunc motum. 13. gr. 12. scr. & in latere sinistro horas 19. datas; datque angulus communis. 10. gr. 27. scr. Cumque horis adhæreant. 28. scr. cum ijsdem in latere quærens, inuenio. 15. scr. 24. sec., quæ cum prioribus addita, efficiunt. 10 gr. 42. scr. 24. sec. sed. 24. sec. negligēda sunt, quia ad dimidiū scrupulum non pertingunt. His additus locus Lunæ in meridie. 21. diei repertus, nempe 24. gr. 12. scr. ♑, locum Lunæ quæsitum indicant 4. gr. 54. scr. ♒.

Aliud exemplum. Lubet scire Veneris motum die. 3. Martij hor. 10. scr. 40. Pomeridiana. motus diei. 3. &, 4. differentia, offert scr. 36. pro motu diurno. Ingredior Canonem horarium, cum hoc motu diurno, ipsum quærens in vertice columnarum: & in latere sinistro, e regione hor. 10. occurrunt in angulo communi scr. 15., & e regione. scr. 40., se exhibet scr. 1. Quæ simul addita efficiunt scr. 16. Hæc aufer a loco ♀ in meridie. 3. diei inuento scil. 15. gr. 37. scr. (quia Venus regressum patitur) residuum dat. 15 gr. 21. scr. Hic verus. ♀. locus est, data hora & scrup.

DE

DE SVPPVTANDIS CONFIGVRATIONIBVS LVNÆ CVM ERRATICIS, ET ERRATICARVM MVTVIS.

In primis considera, quo die Lunæ congressus cum Erratica, aut Erraticarum inter se sit futurus. Tunc modo prædicto vtriúsque motum diurnum elice: Si vterque Planeta progreditur, aut Regreditur, deduc a maiori minorem: sin autem alter sit Directus, alter Retrogradus, vtrumque coniunge. Hoc residuum aut aggregatum serua. Quo facto subtrahe locum Planetæ minorem à maiori, in meridie illius diei inuentum. Deinde cũ priori residuo aut aggregato ingredere Canonem horarium, duplici introitu, si opus est, ipsum quærens in columnarum vertice; & in area eiusdem columnulæ, differentiam motus Erraticarum, in latere sinistro offerent se e regione anguli communis, horæ & horarum scrupula, quæ verum congressus aut configurationis tempus ostendent. Quod exemplis vno aut altro lucidius euadet.

Anno Domini. 1593. Septembris die. 20. animaduerto congressum Lunæ & Veneris Inquisiturus ergo exactum huius congressus tempus, inuenio in Ephemeride, in meridie huius diei locum Lunæ. 28. gr. 50. scr. ♋. Veneris vero. 11. gr. 29. scr. ♌. Motus diurnus Lunæ est. 15. gr., Veneris 52. scr. Cum vterque sit Directus, subtraho minorem ex maiori, residuum est. 14. gr. 8. scr. Simili modo deduco motum Lunæ ex Veneris motu, residuum manet. 12. gr. 39. scr. pro motuum differentia. Cũ priori residuo ingredior Canonẽ horarium quærens ipsum in vertice, & in eadem columnula descendendo, reperio 12. gr. 25. scr. 30. sec.; in latere vero sinistro e regione huius proſelidis, horas. 21. Sed cum motuum differentia, excedat communem angulum iam inuentum. scr. 13. sec. 30, quæro hæc scrupula in eadem columnula, quæ in sinistro latere exhibent scr. 23. Sicque tempus congressus verum fit. hor. 21. scr. 23. post meridiem. 20. diei Septembris.

Aliud Exemplum. Anno. 1593. die. 19. Iunij animaduerto Coniunctionem Solis & Mercurij, distatque Mercurius a Sole scr. 5. Motus Solis diurnus. 57. scr. Mercurij equidem scr. 61. Sed Mercurius mouetur in præcedentia, quare vtrumque motum diurnum coniungo, estque aggregatum 1. gr. 58. scr. Quod inueniens in vertice columnularum, descendendo reperio in eadem columnula 4. scr. 55. sec. & in latere sinistro e regione huius proſelidis, hor. 1. At motuum differentia excedit. 5. sec. quæ in latere sinistro exhibent scr. 1. Quare tempus coniunctionis huius verum, est hor. 1. scr. 1. Pomeridiana. 19. diei.

æquatione,& motus Lunæ emendatione.

Omnia & Solis & Lunæ,Erraticarumque loca, in hiſce noſtris Ephemeridibus, ad dies medios ſiue æquales ſupputauimus. Nunc tempus apparens interdum hoc tempus excedit,interdum breuius eſt:partim Sole, ob proſthaphæreſeos rationẽ, velocius aut tardius progrediẽte: partim quia partibus Zodiaci æqualib.,æqualia tẽpora Æquatoris in cõuerſione diurna nõ reſpondeant. Hinc fit vt hæc temporis inæqualitas,proſthaphæreſi emendanda ſit. Quæ tamẽ nec æqualis, nec certa perpetuo eſſe poteſt. Nam æquatoris circuli conuerſio, quamuis ad medium ſiue Æquale Æquinoctium perpetuo ſibi conſtet æqualiter; tamen ad apparentia Æquinoctia non deprehenditur æqualis;nec & Solis Apogæum firmam ſedem occupat. Eſt quoque Solis Eccentrotetes viciſſitudini obnoxia, quare etiam nullus huic inæqualitati limes perpetuo deſignari poteſt. Quibus recte perpenſis, luce clarius eſt,quod motus Erraticarum noſtris in Ephemeridibus poſiti, non prius cum tempore apparente conuenient, quam æquatio fuerit adhibita. Huius rei gratia Canonem Æquationis dierum naturalium computauimus, noſtro huic ſæculo congruentem, nempe ad annum 1610. qui citra errorẽ ſenſibilem, annis. 50. ante & poſt inſeruire poteſt. Huius uſus talis eſt: verum Solis locum ex Ephemeride ſume,ſignum in vertice,& gradum loci Solis in latere ſiniſtro quærẽs; tunc angulus communis dierum æquationem dabit: hãc addes,aut ſubduces tempori dato,iuxta notularum indicium. In quibus A additionẽ,S. Subtractionem denotat. Quantum vero pro hac emendatione,motui Lunari ſit addẽdum, aut auferendum; ex Canone horario Planetarũ mox percipies. Sed hæc vno atque altero exemplo lucidiora fient.

Data igitur, in hiſce Ephemeridibus, Lunaris deliquij hora,aut Interlunij,aut Plenilunij,aut Quadraturæ hora: Vel dato loco Lunæ quacumque alia hora,horæque ſcrupulo:quæratur eius horæ locus Solis,qui in

Canone mõſtrabit temporis proſhaphæreſim, horis illis datis addendã aut adimendã, prout notæ indicant. Sed ſi tempore apparente dato, quæratur locus Lunæ, ipſis titulis contrarium fieri debet. Sit pro Exemplo: Anno Domini. 1594 die 28. Octobris, Lunæ defectus in hiſce annotatur Ephemeridibus, hora. 18. ſcr. 10, Pomeridianis, tempore medio. Iam locus Solis eſt. 5. gra. 17, ſcr. dodecathemorij Scorpij, cum quo ex tabula ſequenti elicies. 22; ſcr, 49. 2ª. cum notula. A: Quare verum tempus maxime obſcurationis Lunæ, eſt hor. 18 ſcr. 33. fere. Contra, ſi eadem hora 18. ſc. 33. temporis apparentis, quæratur locus Lunæ; temporis hæc poſthaphæreſis ſcilicet ſcr. 23. fere, ablata ex tempore apparente, relinquet hor. 18. ſcr. 10. Huic tempori congruit locus Lunæ. 5. gra. 17. ſcr. Dodecathemorij Tauri.

Reperitur & alio modo locus Lunæ tempore vero. Date tempore vero ſiue apparẽte, quæratur Lunæ locus, ei tempori medio tanquam apparenti, nulla æquationis mentione facta, congruens. Tunc cum loco Solis eiuſdem horæ æquationem temporis excerpe, & cum Lunæ motu diurno ingrediens Canonem horarij motus Planetarum, æquationis ſcrupula iu latere ſiniſtro, dabunt in angulo communi ſcrupula loco Lunæ addenda, aut auferenda: nempe contrario modo quam notæ indicant. Vt Anno Domini 1592. die. 4. Decembris, ſit inueniendus Lunæ locus, hora. 2. Pomeridiana, tempore apparẽti. Iã Solis locus eſt. in 12. gra 25. ſcr. Sagittarij, & per ipſum producitur Æquatio ſcr. 16. 2ª. 7. Motus Lunæ diurnus eſt. 11. gra. 49 ſcr. quare ſcr. 16. 2ª. 7. dãt ſcr. 8. fere a motu Lunæ auferẽda: qui fuit hora data. 19. gra. 16. ſcr. ♑. Erit itaque locus Lunæ tempore apparente dato, 19. gra. 8, ſcr. ♑. Hac loci Lunæ emendatione vtendum eſt, in omni Themate Cæleſti erigendo.

Hi tituli A. et S. locum habent, cum tempus medium convertitur in apparens: Sed his titulis contrarium est faciendum, cum tempus apparens in æquale commutatur.

DE SIGNIFERI SIVE SOLIS DECLINATIONE AB AEQVINOCTIALI CIRCVLO.

Signiferi siue Solis declinatio, est Solis, siue partium signiferi ab Æquatore ad Tropicos digressus siue descensus, cuius interuallum, arcus Coluri Tropico & Æquinoctiali interceptus circulo, metitur. Eius causa Planetæ interdum vertici nostro propinquiores, interdum remotiores sunt: quorum omnium Sol vnam & simplicem obtinet digressionis ab Æquatore inæqualitatem, sicut & accessus & recessus a nostro vertice: nam Sol constanter sub linea Ecliptica graditur. Quare cognita declinatione graduum Eclipticæ ab Æquatore, simul & Solis declinatio nota est. Quæ deducta si fuerit a latitudine tuæ habitationis, siue alicuius ciuitatis, aut loci; Sole peragrante Borealia dodecathemoria, vel eidem addita, si in Australibus fuerit signis, Solis a nostri loci vertice meridianam distantiam exhibet, qui Zonam temperatam incolimus Borealem. Hæc Solis declinatio & si sit variabilis, maxima tamen eius declinatio, huic sæculo conueniens, est partium. 23. scr. 28. fere, quãdo eius declinatio minima est: quod in Canone sequenti conspici potest.

CANON LATITVDINIS LVNAE

Quemadmodum Sol ab Æquatore declinat, scilicet Boream augendo declinationem ab Arietis initio, ad Cancri principium; & inde ad libræ initium, eandem minuendo: deinde in Austrum descendendo & rursum ascendendo simili modo augendo & minuendo: Sic Luna ab Ecliptica declinat. Nam a Capite Draconis siue Nodo Boreo eius augmentatur latitudo Borea, donec ad Boreum peruenerit limitem: inde decrescit donec Caudam Draconis, siue Nodum Austrinum consequatur, Postea vero in Austrinum limitem usque eius Australis crescit latitudo: quæ rursus minuitur, donec ad Boreum nodum pertingat. Hanc si quouis tempore scire voles, distantiam Capitis Draconis a loco Lunæ inquiras, subducendo gradum & scrupulum Capitis Draconis, a vero loco Lunæ (additis duodecim signis loco Lunæ si opus fuerit) numerus reliquus inæqualitatem latitudinis Lunæ exhibebit: per quam ex Canone sequente eius venaberis latitudinem, Borealem ascendentem vel descendentem, si sex dodecathemoria non excesserit: inde ad 12. signa Australem latitudinẽ habet ascendentem vel descendentem. Estque eius latitudo maxima, partium quinque, Quod ex sequenti Canone facile percipies.

DE BVPLICI CATALOGO STELLARVM FIXARVM INSIGNIORVM.

Duos ſtellarum fixarum hic addimus Catalogos: quorum prior longitudines, Latitudines, Declinationes, Aſcentiones rectas, Magnitudines, & Proprietates ſiue naturas continet, ſupputatas ad annum Salutis humanæ. 1600. Alter vero exhibet Ortus & Occaſus earum tum matutinos, tum veſpertinos, quibus in noſtro horizonte, cuius latitudo eſt 51. graduum cum ſemiſſe, ſunt obnoxiæ, atque Cæli mediationes. Gradus vero in ipſo poſiti, ſunt in quibus Solé coſtituto, ſtellæ vbique locorum culminant: vel in horizonte Brugenſi, Coſmicé, vel Acronice, vel Heliace Oriuntur aut Occidunt.

Ortus Coſmicus, eſt aſtri una cum Sole ſupra hoizontem emerſio, quod tamẽ propter lumen ſolare, quo obſcuratur, videri non poteſt.

Occaſus Coſmicus, eſt aſtri ſub horizontem deſcenſio, ſole ex aduerſo aſcendente, quamuis illud aſtrum per totam noctem cerni poteſt: hi ortus, & occaſus matutini appellantur.

Acronicus Ortus, eſt veſpertina ſtellæ emerſio, Sole e regione deſcendente.

Occaſus Acronycus, eſt aſtri veſpertina ſub Horizontem deſcenſio vna cum Sole & dicuntur Ortus & Occaſus veſpertini.

Heliacus Ortus, eſt apparitio aſtri, quod antea ob Solis vicinitatem non poterat conſpici.

Heliacus Occaſus: eſt aſtri occultatio, quæ fit Sole ad aſtrum accedente. Nam Sol ad ſtellam aliquam accedens, quæ antea veſperi in Horizonte mox poſt Solis Occaſum cerni poterat, ipſam radijs ſuis tegit, vt non amplius veſperi appareat, donec Sol in tantum ab ea diſceſſerit, vt etiam apparere incipiat: tunc enim iterum Heliace oriri incipit. Hic Occaſus Ortum præcedit. Sed certo definiri non poteſt. quanta debeat eſſe vicinitas ſtellæ ad Solem vt tegatur ſeu obſcuretur, aut quanta debeat eſſe diſtantia a Sole, vt iterum appareat. Stellæ enim non ſunt eiuſdem magnitudinis. Præterea habent inæquales latitudines. deinde & ſigna cũ quibus ſtellæ aſcendunt vel deſcendunt, non habent eandem rectitudinem aut obliquitatem. Vltimo variat quoque tempus, apparitiones & occultationes ſtellarum. Quare in hoc Catalogo, gradus poſuimus quos Sol inambulat cum eadem ſtellæ Oriuntur aut Occidunt Helice: quos ſupputauimus ante aut poſt Ortum & Occaſum verum non in Ecliptica, ſed arcu verticalis circuli tranſeuntis per centrum Solis, qui ſub terra inter Solis centrum & Horizontem iutercipitur.

Catalogus stellarum fixarum insigniorum, Longitudinem, Latitudinem, Magnitudinem, Declinationem, Ascensionem rectam et naturas earum continens.

Cata-

Catalogus locorum & vrbium maxime nobilium.

Exhibemus tibi hunc locorum Catalogum, lector candidissime, ex recensione probatissimorum Geographorũ: cuius usus vt facilior esset, longitudinum differentiam, in horas & horarum scrupula reduximus: habentque loca a Brugis Flandriæ ortum versus distantia, A. additionis notam præscriptam. Numerant enim illi qui a nobis versus ortũ habitant, plures horas ad certum aliquod momentum: contra autem ad Occasum degentes. Quare illis locis. S. subtractionis nota præfixa est.

Nunc cum Ephemerides nostræ supputatæ sint ad longitudinem Meridiani per Brugas transeuntis, fieri non potest, vt eadem lunæ Eclipsis, aut interlunium, Pleniluniũm, aut quadratura, aut Solis ingressus in puncta Cardinalia, in alijs regionibus atq; locis vno eodemque horæ scrupulo vbique eueniant, quo in hisce nostris Ephemeridibus recensetur, quare reductio necessaria erit. Quæ facillima erit, nempe addito vel subtracto temporis spacio, quod alteri loco aut ciuitati ad latus adscriptum est. Exempli gratia. Anno. 1596. die 12. Aprilis hor. 8. scr. 7. Post meridiem tempore apparenti, Offert calculus Eclipsis Lunæ maximam obscurationem, in hoc nostro Horizonte. Iam vt facillime addiscas quo tempore Eclipsis eadem Tubingæ conspicietur: habes in Catalogo scr. 23. vnius horæ Tubingæ adiacentia, cum additionis nota: quæ addita, tempus verũ ostendent. hora, 8. scr. 30. Pomeridiana.

Quod si aliquo certo tempore dato, motus Lunæ aut sideris cuiusdam, in alio quæritur Horizonte: prædictis contrarium faciendum est. Nam motus qui debetur differentiæ temporis adscripti, auferendus est, si A. nota reperitur: addendus vero, Si S. nota adfuerit. Atque si non adeo scrupulosus es, pro singulis horis addes vel demes scru. 30. vnius gradus, & pro scrupulis duobis temporis, motus scrupulum vnum, pro motu Lunæ. Quod exemplo clarius euadet.

Sit locus Lunæ inueniendus in horizonte Romano die. 11. Iunij hora. 3. Pomeridiana, anni. 1593. Differentia temporis Romæ adscripta, inuenitur hor. 1. scr. 4 cum nota A. locus Lunæ in Ephemeridibus nostris ad tempus datum colligitur 27. gra. 57. scr. ♑ Cumque Roma scr. 64. vnius horæ Orientalior sit, aufero a iam dicto Lunæ motu scru. 32. Quare ad horizontem Romanum Lunæ locus erit 27. gr. 25. scr. ♑ 27 gr. 25.

Verum & hoc monendum est. Et si secundum iam dictum ordinem, motus omnes in Ephemeridibus nostris supputati, adhibita correctione alijs orbis terræ locis congruant, Solares tamen Eclipses inde excipiuntur. Id quidem fit propter Lunaris parallaxeos inconstantiam: ideoque vni tantum horizonti accommodantur sensibili. Nam cum Sol, reuera lumine non priuetur, sicut Luna, sed tantummodo ob Lunæ interuentum aliquam terræ particulam non possit illuminare, sitque Luna Sole & terræ multo minor: necesse est vt loca Septentrionalia a Meridionalibus, maiorem aut minorem deliquij magnitudinem percipiant. Quare nec idem durationis tempus erit, nec initij & finis idẽ momentum Orientalibus & Occidentalibus, vt in Luna, apparet: immo sæpe euenit vt Orientales nullum adhuc luminis defectũ percipiant, sed adhuc exspectent, eo tempore quo Occidentalibus Sol omni labore liberatus, toto circulo iterum luceat. Hac de causa quo ad Eclipses Solares, Ephemerides non omnibus ex æquo, sicut in reliquis apparentijs satisfacere possunt.

Catalogus locorum maxime insignium in diuersis Regionibus.

Nunc binos adijcimus Canones: quorum prior compræhendit converſionem Temporum Æquinoctialium in Horas & Horarum Scrupula: Alter converſionem Horarum & Scrupulorum in Tempora & Scrupola Æquinoctialia. Per priorem, data longitudinis locorum differentia in Temporibus, mox eadem in Horis & Horarum Scrupulis innoteſcet. Per alteram vero, datis Horis & Scrupulis diſtantiæ locorum, eadem diſtantia in Temporibus & Scrupulis erit cognita.

Canones

Canones conuersionis Horarum & temporum Æquinoctialium.

Canon convertendi tempora Æquinoctialia in Horas & earum Scrupula.

DE DOMIBVS COELI, ET FIGVRÆ CÆLESTIS ERECTIONE.

Variæ Astronomorum imaginationes, diuersas domorum Idæas conceperunt: Omnes tamen semicirculum quendam in sex æquales partes, partiuntur; & per easdem sectiones, duoque Cæli opposita puncta, maximos ducunt circulos, quibus cæli domicilia distinxerunt. Attamen omnes fere in semicirculi descriptione variarunt.

Ptolomæus meminit lib. 3. Prædictionum, hemicycliorū hora æquinoctiali distantium (quæ per communes Horizōtis & Meridiani sectiones ducuntur) quæ æquatorē vbique æqualibus prætergrediuntur temporibus, Zodiacum autem partibus inæqualibus. Insuper spacia inter Meridianum & Horizontē per inæquales metitur horas. Hinc constat Ptolomæum non diuisisse Zodiacum in spacia æqualia (vti vult Erasmus Rheinholdus) sed æquatorem alioqui æqualibus, hæc deductio, non inæqualibus horis absolui poterat: De quo in Astrologico nostro opere latius.

Nec Iulius Firmicus æqualem Zodiaci partitionem asseruit, (vti omnes opinantur) qui de Cardinibus figuræ cælestis iudicia proferens, vbique ait: Si tale aut tale signum fuerit in Cæli medio: hoc est exempli gratia, Si horoscopante Tauro fuerit Aquarius in Cæli medio. &c. Vnde liquet ipsum nullo modo admisisse æqualem Domiciliorum in Zodiaco partitionem: cum ea ratione semper Aquarius in decima domo esset: habuisse tamen respectum aliquem, non nego, ad æqualem Zodiaci diuisionem, vbi docet gradum, 90. ab horoscopo; non esse negligendum.

Abraham Abenezre, & post ipsum Ioannes Regiomontanus, Æquatoris semicirculum accipiunt; ex cuius Polis 12. ducunt circulos, totiusque cæli circuitum in duodecim domicilia per Æquatorem æqualia, per Zodiacum vero inæqualia partiuntur.

Campanus & Gazulus semicirculum cuiusdam verticalis circuli (quem super communi sectione Horizontis & Meridiani, tanquam Polo descripserunt) in partitiones æquales distribuerunt: quæ tamen ad Zodiacum & æquatorē collatæ, sunt inæquales.

Alchabitius eiusque Commentator Ioannes de Saxonia, assumunt semicirculum parralleli per gradum Orientē descripti, & Meridiano interceptum circulo, omnesque circulos ex Polo mundi ducunt, imaginatos (inquam) per Ascentiones rectas.

Porphyrius (Gaurico teste) interstitium signiferi, quod est inter Cæli culmen & finitorem, diuidit in tres partes æquales: quarum primam addit culmini Cæli: collectum domus 11. cuspidē exhibet: huic cuspidi adiungit alteram trium partium, & cōflat. 12. domus initium. Cui addit postremam partem, vt primæ domus apicem ostendat. Eodē præcise modo diuidit interstitium Horizontis & Imi Cæli, & parat sibi domus secundæ, tertiæ & quartæ cuspides. Reliquas sex domos cælestes, e regione per diametrum ponit.

Diuersa hæc thematum repartitio, plurima peperit incerta in rebus Astrologicis iudicia, cum quilibet ipsorum veterum exempla atque iudicia obseruata, ad suas Cæli partitiones nuper inuentas detorqueat. At nouis Hypothesibus, noua sunt accommodāda iudicia, aut certis terminis & spacijs includenda. Sed hæc alibi latius. Horum modorum præstat (meo iudicio) ille Ptolomaicus: huic proxime accedit Ioannis Regiomōtani modus, qui & Rationalis appellatur. Nos quidem ad mentem Ptolomæi vnicam supputa-

putauimus tabulam, scilicet ad latitudinem 51. graduum cum semisse: in qua quælibet domus ab altera duas distat inæquales horas: qui alterius ad loci latitudinem similem supputare volet, non inconsultum erit. Quæ reliquæ sunt tabulæ per vsitatum rationalem modum sunt computatæ.

MODVS ERIGENDI COELESTE THEMA PER TABVLAS DOMORVM SEQVENTES.

Primum dato & æquato tempore meridiei, ex Ephemeridibus sume locum Solis. cuius signum quære in fronte tabulæ latitudini tuæ habitationis inscriptæ, aut viciniori; gradumque Solis in linea domus decimæ perquire. Quo inuento e directo gradus Solis, sex domorum, nempe decimæ, vndecimæ, duodecimæ, Primæ, Secundæ, & Tertiæ, cuspides manifeste occurrent. Ipse enim Solis gradus, Regiæ domus, quam decimam vocitant, cuspis erit. Sin autem Solis gradui scrupula adhæserint, eadē cum Solis gradu ipsoque Sole, in decimæ domus cuspide pones. Deinde reliquas domorum cuspides cōfer ad cuspides immediate sequentes, quæ semper sunt maiores: deque earum differētijs & scrupulis Solis, sume partes proportionales secundum sexagenariam proportionē partemque quamlibet suæ domus cuspidi prius excerptæ iunge: sic conflabis veram cuiuslibet domus cuspidem.

Quod si ad tempus quodlibet postmeridianum figura Cæli constituenda sit: cum signo & gradu Solis ex Ephemeride ad datum tempus collecto ingredere, vt supra, tabulam domorum latitudini tui loci congruentem, aut proxime viciniorem, & e directo gradus Solis sinistrorsum excerpe tempus in horis & minutis inuentum. Sin autem Solis gradui minuta adhæserint, temporis differentia sumetur, de qua & scrupulis Solis accipienda erit pars proportionalis ad 60. quam adde tempori iam excerpto, addēdo scrupula scrupulis, & pro 30. scrupulis secundis si excesserint, scrupulum vnum. Tempori sic rectificato prò gradu & scrupulis Solis, adde tempus pomeridianum datū; horas horis, & scrupula scrupulis: quæ si 24. superauerint, reiectis 24. residuum serua. Huic residuo, pro singulis sex horis a meridie elapsis, adijce scrupulum vnum, sic tempus iustum, & tuæ intentioni idoneum conflabis. Cum hoc tempore tabulam ingredere domorum tuæ habitationis latitudini conuenientem, aut proxime viciniorem, domorumque cuspides, vt supra elice. Hoc tamen monendum, quod quotiescunque tempus aptatum non fuerit præcise in tabula repertū, intrandum sit cum proximo minori illic reperto; & cum temporis differentia, accipienda erit pars proportionalis de differentia singularum cuspidum, 6 domorum, secundum sexagenariam proportionem: quarum singula suæ debitæ cuspidi est iungenda: sic rite æquabis sex domorū cuspides: quibus cognitis reliquas sex, partili diametro e regione formabis. Postremo constitutis duodecim domicilijs, insere, prout res ipsa exigit, Erraticarum loca, ijs in domibus quæ gradum quem Planeta inambulat, comprehendunt.

DE

DE REVOLVTIONIBVS SIVE CONVERSIONIBVS ANNVIS.

Conuersio annua est tẽpus illud, quo Sol ad idem Æquinoctium, vel Solstitium, aut alium certum locum reuertitur, quẽ dato aliquo certo initio inambulauerat. Huius facilis erit inuentio per binas subsequentes tabulas, quas in illum finẽ constituximus, iuxta Anni Tropici magnitudinẽ, nostro huic seculo congruentem. Quarum usus talis est.

Primum considerabis an alicuius temporis datum initium, cuius Reuolutionem quæris, sit ne Annus Intercalaris, an Primus, an secundus, an Tertius post Bissextilem. Tunc annos completos a genituræ tempore elapsos, obseruabis: quorum numeros, aut unico, aut duplici, aut triplici ingressu, singulos excerpe, titulos que considera, an addẽdi sunt inuicẽ, an subtrahendi, & an simul iuncti, initio temporis dati, sunt addendi, an subducendi: tunc summam serua, eamque initio temporis dati, addes vel auferes pro maiori numero addendarum aut subtrahendarum horarum. Exempla gratia.

Sit aliquis natus anno Domini. 1569, mensis Iunij die 30. hora, 16. Scr. 7. post Meridiem. Nunc tempus quærendum est, quando Sol reuertetur ad locum, quem partus tempore, post annos. 27. completos obtinebat: qui erat gradus 18. Scr. 19. 51. Cancri. Primum obseruo annum. 1569. fuisse primum post Bissextilem: Iam in priori tabula, pro annis 20. inuenio hor. 2. Scr. 8. 40: auferenda: & pro 4 annis, Scr. 25. 44. auferenda. Iterum cum tribus reliquis annis ingredior tabulam quæ congruit Anno post bissextũ primo, & reperio hor. 6. Scr. 19. 18 similiter auferẽda. Hæc excerpta simul coacernata, efficiunt hor. 8. Scr. 55. 42, Hanc summam subtrahe ab initio temporis dati, siue huius genituræ, residuum erit tempus apparens, quo Sol reuertitur ad locum genituræ: id quidem erit die. 30. Iunij hora 7. Scr. 13. 18. Postremo cum gradu Solis Tabulam alteram, nempe Æquationis Reuolutionum ingredior: vbi e regione grad. 18. Cancri inuenio. Sec. 9: quæ per annos completos 27. multiplicata, producunt Scr. 4. 3.

Hæc iuncta Hor. 8. Scr. 18. exhibent tempus apparens omnino æquatum, & conversionis annuæ initium futurum die 30. Iunij. Hor. 7. Sc. 17. 21. post Meridiem, stylo Romano veteri,

Anno, 1596.

De Aphætarum deductionibus, siue directionibus, iuxta Ptolomæi doctriuam.

Erecta Cæli figura, Aphætam, siue vitæ Prorogatorem, quem Arabes Hylech vocant, iuxta Ptolomæi sententiam elige. Deinde reliquorum euentuum significatores obserua. Horoscopus, valetudinis ac peregrinationis statum progressione explorat. Sortis fortunæ progressus, bonorum incrementum, aut decrementum, indicat. Ex Lunæ generali progressu, Animi mores & conuersatio venantur. Ex Solis progressu dignitatis, honorũ & gloriæ exitus, consideratur. Reliquas vitæ actiones, liberorum procreationẽ, amicitias, ex Cæli culminis progressu inquirimus.

Omnis Progressio fit bifariam: aut in consequentia, aut Præcedentia: & per Arcus semidiurnos, aut seminocturnos tempus mensuratur, iuxta spatia interposita inter significatorem & promissorem, facta vtriusque comparatione ad Cardinem Medij aut Imi Cæli. Distantia enim significatoris a Cæli medio aut Imo, multiplicatur, per arcum semidiurnum promissoris, si significator fuerit supra terram: aut per eius arcum seminocturnum, si sub terra significator fuerit, & progressio fuerit in consequentia. Productum vero partitur per arcum semidiurnum, aut seminocturnum significatoris: numerusque quotus annos & menses, dieſque futuri euentus ostẽdit. Cardanus dicit partem 72. totius numeri quoti, ex Ptolomæi sententia, adhuc addendam esse, sed non memini me vnquam apud Ptolomæum legisse. E contra fiet si in antecedentia fiat directio, idque si significatores Cardinum centra non occupauerint.

Sed si significator in centro fuerit Horoscopi, tunc regionis ascensionibus obliquis utẽdum erit. Sin autem Cæli culmen, aut imum tenerit, Ascensionibus rectis, operandum est. At si Occidentis occupet centrum, descẽsionibus obliquis Regionis, negotium absoluetur.

Tempora euentuum, & eorundem conditionem bonam aut malam, decernunt cũ generales progressus, tum status atque conditiones significatorum & promissorum, siue locorum, in quos ijsdem temporibus incidunt.

Praxim harum progressionum, exemplis hic non ostendimus, quam in opere nostro Astrologico clare explicauimus. Hic usum tantum breui sermone tibi indicandum sumpsimus, qui facilis est & firmus, nullis positionum circulis, neque declinationibus laborioſus.

Qui Ephemerides condiderunt, eas toti fere Europæ inseruientes, tradere studuerunt, eaque de causa tabulas domorum præcedentes construxerũt: quas & nos hisce nostris Ephemeridibus adiunximus. Præter has, Canonem addidimus Ascensionum Rectarum, & Canonem Ascensionum obliquarum, qui Latitudini gtaduum 51. cum dimidio convenit. Demum adiecimus tres alias domorum tabulas, quarum tertiam, pro Horizonte Brugensi (ad cuius Longitudinem hæ Ephemerides sunt, supputatæ) vbi Poli altitudo grad. 51. cum semisse continet, computauimus Ptolomaico modo: in qua quælibet domus binas horas inæquales ab altera distat. Prima vero a Mæstlino pro Horizonte Tubingensi, ad Latitudinem 48. grad 30. Scrup.; & altera a Ioanne Schonero, pro Horizonte Norimbergensi, ad Latitudinem 49. Scr. 30. constructæ fuerunt.
